1 Wazuh Dashboard

The Wazuh Dashboard is the web user interface for visualization, analysis, and management of security data within Wazuh. The Wazuh dashboard acts as the bridge between analysts and the data stored in the Wazuh indexer.

2 Features

2.1 Security Data Visualization

The Wazuh Dashboard provides pre-built dashboards to analyze alerts, security events and log data.

2.2 The MITRE ATT&CK Framework Mapping

The Wazuh Dashboard automatically links every alert to The MITRE ATT&CK Framework to identify the strategy that is being used.

2.3 Vulnerability Management

Wazuh provides continuous scanning to identify risks. The dashboard visualizes these risks showing you where the vulnerabilities are and how critical they are.

3 Ports

The default Wazuh web user interface port is **443**, this is also used by the Wazuh dashboard. It is possible to change the port by using one of the following commands

- `-p <PORT_NUMBER>`
- `--port <PORT_NUMBER>`

In the documentation of Wazuh, it is recommended to use one of the following ports for the dashboard: **8443**, **8444**, **8080**, **8888**, or **9000**.

4 Dashboard Dependencies

The Wazuh Dashboard is heavily dependent on the other components within Wazuh itself, like the Wazuh Indexer and the Wazuh Manager. The dashboard requires the Indexer to store the index, query alerts, archives and agent data. Visualization is impossible without the Wazuh Indexer. The Wazuh Manager provides an API which makes it possible for the dashboard to retrieve real time data, agent configurations and to perform actions.

5 Workflow

1. **Log collection:** Wazuh agents collect the logs.
2. **Data Decoding:** The Wazuh managers decodes and analyzes the collected data against a set of rules. These rules are there to differentiate normal activities from potential security threats.
3. **Indexing and storing:** When a threat is detected, it will be sent to the Indexer, the central repository for storing and indexing security alerts.
4. **Visualization:** The dashboard pulls the data from the Indexer and displays it with charts and alerts.

6 Example

Here below is an example picture of what a Wazuh Dashboard looks like:
